## Pregnancy Center

*Offering Hope and a Future*

### Did You Know?

**The chemical abortion pill CAN be reversed...  
If done in time!**

As stated in the last post in the "*Did You Know?*" series, this dangerous pill regimen has been approved by the "FDA" up to [10 weeks of pregnancy](#).

The regimen involves taking two different drugs: mifepristone and misoprostol. Mifepristone is usually taken first, blocking progesterone, the hormone in a woman's body that sustains the pregnancy. Misoprostol is taken 24-48 hours later, which causes the mother's uterus to contract and expel her deceased baby.

After taking the first pill (mifepristone), some women regret their decision. It is here that time is of the essence. Abortion pill reversal starts by calling the Abortion Pill Reversal hotline: 877.558.0333 or visiting [AbortionPillReversal.com](http://AbortionPillReversal.com).

Once the call is placed, medical professionals prescribe the natural hormone progesterone and data shows [64-68% of pregnancies are saved through abortion pill reversal](#). For women who took progesterone to reverse the abortion pill, the rates of preterm births and birth defects were either the same or lower than the rates of the general population. [More than five thousand babies have been saved](#) because brave women made the call!
